

Sasolwax

Mottled Candles

Sasolwax 5544

Sasolwax 5544 is a highly specialised paraffin wax for production of mottled candles by the moulding method.

Moulds: Recommended are Plexiglas[®] moulds, but moulds made from other materials may also be suitable.

Important: The moulded candle has to be cooled carefully and slowly at room temperature. Do not release the candle from the mould until the candle has completely cooled down. The crystallisation process in the product continues until the candle is completely cold.

Coloration: Use fat soluble colours only. Pigment colours will prevent crystallisation and as a result the candle will not show the desired effect.

This product cannot be mixed with any other paraffin wax, stearic acid or polyethylene additives! Any attempt to blend the material with some of the above will destroy the desired effect.

Mould release: Sasolwax 5544 has a very good mould release due to its unique characteristics.

Sasolwax 5544 can not be mixed with *Scenti Masterbatch* but with conventional liquid perfumes. Recommended is a percentage of approximately 3 %.
