

Sasolwax

Container Filling Paraffin Wax

Sasolwax 6214

Moulding paraffin wax for glass jars and similar container-candles

Sasolwax 6214, which is based on low melting paraffin waxes, is suitable for moulding. It has been especially developed for the use in glass jars and similar containers for "one fill" operations. Owing to the improved low contraction a good appearance and a smooth surface are achieved.

The low melting point ensures that the wax burns down completely, in the containers, even when using a smaller sized wick.

The potential of the flame to develop soot and deposits on the upper edge of the glass are thus avoided or minimised.

The wax composition exhibits excellent fragrance retention.

Due to the higher melting point this material is particularly suitable for warmer climates.

To obtain candles entirely free of air bubbles the filled containers must be placed in a heating cabinet (70 - 75 °C). The length of time the candles should be thus stored depends on the shape and weight of the candles and containers and is between 1 – 3 hours. The adhesion of the product to the walls of the jar is also improved by this heat treatment.

Attention!

Attention should be paid to the low melting point when storing / shipping and during display.
