

Sasolwax

Overdipping Wax

Sasolwax KTM 20

Transparent Overdipping Mass

Application:

KTM 20 was specifically developed for the over-dipping of printed/embossed candles and the protection of stickers/adhesive pictures.

KTM 20 can be used when dipping by hand as well as in dipping machines.

Characteristics:

The coating of *KTM 20*, when dipped, is significantly more transparent than the dipping masses usually used in this application so the brilliance of prints and pictures is not diminished.

Smooth, scuff resistant surfaces may be achieved using *KTM 20*.

It is only necessary to dip once to obtain the desired effect.

Working Conditions:

In order to achieve optimal shine the candles which are to be dipped should not be too cold i. e. around room temperature.

We recommend the following conditions:

A dipping temperature of 80 - 85 ° C, do not cool using water.
