# Overdipping Wax

## Sasolwax KTM 21

---

### **Universal overdipping wax suitable for all candle diameters**

**Application:**

*KTM 21* is mainly for use with automatic dipping machines with a high production capacity. However, dipping by hand is possible, using a shorter open time.

**Characteristics:**

This is a low viscosity overdipping wax used to achieve a matt finish. Normal fat soluble or pigment colours are used. The wax burns down so as to leave an even wax pool rim.

*KTM 21* does not contain combustion inhibiting high molecular polymers. A special stabiliser has been added which suspends the colour, thus counteracting the colours leaving deposits in the dipping bath.

**Working Conditions:**

We recommend dipping twice in order to obtain an optimum matt finish. We further recommend that the overdipped candles are not water but air cooled.
